

PROPERTY ADDRESS

Site Details	Flat/Street No:	Street:		
	Suburb:		Lot:	DP:

In accordance with the Building Code of Australia all new building work is required by law to be protected against Subterranean Termite attack as defined in the Australian Standard 3660.1-2000 - Termite Management Part 1: New building work, and Council’s Policy/Requirements.

Note: Council’s policy on termite management is that new building works are to be carried out in accordance with the Building Code of Australia and Australian Standard 3660.1. However, because of the limited residual life of chemicals used as a “chemical barrier” which are applied beneath concrete floor slabs in buildings, Council requires that other means of physical barrier treatment be used in conjunction with chemical barriers.

Council requires termite protection for all new buildings to be undertaken to provide protection to the whole building inclusive of structural and non-structural elements.

Nominate method of Subterranean Termite Protection
Perimeter Protection
- Joint Protection
- Pipe Penetrations
